

Dirt streets that make sense

Maber Industrial SA de CV

Toluca Mexico

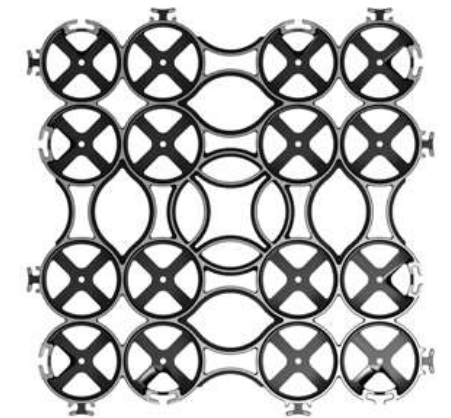

Initial comments:

- Sustainable Communities can have nice streets that are more “amicable” with the environment by using new ideas.
- This presentation illustrates in a graphic way how best to do it on places where asphalt is either not desired and good roads are needed for light traffic.
- Developers for new Real Estate Projects find this technology acceptable and can deliver proper parking lots and very stable streets even under severe weather and high winds.
- The technology show here is available for small or large Street integration to any typical development in the Yucatan Peninsula or the Mexican Pacific Riviera

- After clearing ways for streets and roads, from trucks that get to the site, you can download mats that conform to the Surface of the recently leveled Street path.
- After three simple processes of adding two types of gravel and the use of a steam roller, the streets are ready for different types of vehicle traffic.

- This patented grill can be extended and linked through out the whole street path way in order to make a new road safe and heavy rain resistant.

- Parking lots can be transformed from simple to beautiful with this technology.
- For extra smooth results you can use a steam roller to make a more compact Surface.
- For places where floods are common where typical streets develop “pot holes” this system is the solution.

- Simpler environmental friendly streets for:
- Eco Hotels,
- Golf courses
- Sustainable Communities for retired citizens
- Pueblo Magic sponsored town refacing at Vallarta, Baja California, Quintana Roo, Belize, etc.
